

iDataRepair™

Management And Piece Level Reporting Software

iDataRepair™ is designed to notify print or insert operators immediately of processing errors such as missing or duplicate scanned items, as well as items that need to be pulled or removed from the production process because of special handling needs. The "Pull Items" list can be sent to iDataRepair™ remotely or added manually at the user interface.

iDataRepair™

Reports of the current or past local jobs can be created within the user interface and printed or saved as PDF files and sent to anyone for review or notification of: Total processing time, description of manually handled items, missing, duplicated and Items requiring reprint, other information is also available.

iDataRepair™ can be utilized using a local or a networked database. The advantage of a networked centrally accessed database is, if several machines are processing the same job, then the data is shared between all iDataRepair™ stations running that same job and the reports are global for that job as opposed to only one machine specific.

Software Features:

- › Ease of job setup and monitoring
- › Integrated database communication control for centralized monitoring
- › Easily incorporates into existing process flow
- › Easy servicing and maintenance
- › Can be used in localized or networked operation
- › Convenient touch screen compatible
- › Operational controls easily managed
- › Ethernet equipped

Specifications:

- Operating System: Windows XP Embedded or Optional Windows 7
- Refresh Rate: Every 2 seconds
- Communication: Ethernet for database access

ServiceInSeconds™

Service is extremely important to DDS. To that end, DDS developed ServiceInSeconds™, which gives our technicians the ability to connect through the internet, directly to our system at your request. This allows a DDS technician to virtually be on sight in a matter of seconds to help resolve any issues and keep you in production. The ability to connect to ServiceInSeconds™, is built into every DDS system.

For more information on how Document Data Solutions can help increase integrity in your production, give us a call.

iDataRepair™ Features

Will notify the operator of any individual missing pieces. Operator can click a button to place in a Reprint File for later processing

Remedy buttons can be added and renamed as needed

Will notify the operator and stop duplicate pieces or jobs from processing

Will notify the operator of any individual piece you want removed from processing and instruct the operator what to do with the piece

pieces can be identified and moved into the Reprint file for later processing to ensure every piece is processed

iDataRepair™ Reports
